Contents

Preface, ix

1 Mechanical System Interfacing: Introduction 1
1.1 The Interface 2
1.2 Mechanical System Design Philosophy 2
1.3 Mechanical System Time Scales 4
1.4 Major Topics 5
1.5 Problems and Discussion Topics 5

2. Combinational Digital Logic 7
2.1 Quantized Signals 7
2.2 Error-Free Coding 8
2.3 Static/Dynamic, Algebra/Calculus 9
2.4 Counting and Binary Numbers 9
2.5 Gray Code 10
2.6 Boolean Algebra 11
2.7 Boolean Equations 12
2.8 Axioms 13
2.9 Theorems 13
2.10 Logic System Design 13
2.10.1 Function Generation from Truth Tables 14
2.11 Logic Function Minimization 15
2.12 Karnaugh Map 17
2.13 Don't Care Combinations 18
2.14 Hazards 18
2.15 Physical Realization of Boolean Functions 20
2.15.1 Relay Logic 20
2.15.2 Programmable Logic Controllers (PLC) 21
2.15.3 Implementation Conventions 21
2.15.4 Fluid Logic 21
2.15.5 Electronic Logic 21

2.15.6 Logic Block Diagrams 22
2.15.7 Door Latch in Circuit Form 23
2.15.8 Practical Considerations 23
2.15.9 Connecting to a Bus 25
2.15.10 Analog-Digital Conversion: The Schmidt Trigger 25
2.16 Programmable Logic Devices 26
2.16.1 ROM as a Logic Device 27
2.16.2 PAL, Programmable AND, Fixed OR; PLA, Both Programmable . 28
2.16.3 Erasable PLDs 30
2.16.4 Logic Optimizing Compiler (LOC) Input 31
2.17 Problems and Discussion Topics 34

3 Synchronous Sequential Logic 37
3.1 Flip-Flops 38
3.2 Synchronous Systems 43
3.3 State Transition Logic 44
3.4 Next-State Table 44
3.5 State Assignment 45
3.6 Memory Elements for Synchronous Circuits: D Flip-Flops 45
3.7 Other Synchronous Memory Elements 48
3.8 Using EPLDs for State Machines 49
3.9 Asynchronous Inputs 53
3.10 Moore-Mealy Machines 54
3.11 State Table Reduction 54
3.12 Metastability 55
3.13 Problems and Discussion Topics 56

4 Asynchronous Sequential Logic 59
4.1 Flow Tables 59
4.1.1 Set-Reset Flip-Flop Design 60
4.1.2 Flow Table Reduction 61
4.1.3 State Assignment 61
4.1.4 Excitation Map 62
4.2 Hazards 63
4.3 Design of a Toggle Flip-Flop 63
4.4 State Adjacency 65
4.5 Output Assignment 67
4.6 Excitation Network 68
4.7 Asynchronous Design for Door Lock 68
4.8 PLDs and Asynchronous Logic 69
4.9 Problems and Discussion Topics 69

5 Simple Computer Structure: Register Transfer Logic 73
5.1 Registers 74
5.2 Data Bus 74

5.3 Control Signals 76
5.4 Input–Output Bus 77
5.5 Commercially Available Buses 78
5.6 Multiple Processor Buses 79
5.7 Problems and Discussion Topics 79

6 Embedded Control Computers 81
6.1 Motivation, Application Requirements, and Architectures 82
6.2 Basic Features of Embedded Computers 83
6.2.1 Memory 83
6.3 Architectures of Single-Chip Computers: Microcontrollers 84
6.3.1 Basic Architecture 84
6.3.2 Architectural Evolution 85
6.3.3 On-Chip Input–Output 86
6.3.4 High-Speed Input–Output 87
6.3.5 Microcontroller Configurations 87
6.4 Digital Signal Processors 88
6.5 RISC and High-Speed Floating Point 89
6.6 Embedded Application of PCs 90
6.7 Watchdog Timers 90
6.8 Software Development Environment 91
6.8.1 Example 1: Consumer Product, four-bit Processor 92
6.8.2 Example 2: Technologically Complex Control Application 92
6.8.3 Example 3: Computationally Intensive Signal Processing or Control 93
6.8.4 Example 4: Application with Data Base or Archival Needs 94
6.9 Problems and Discussion Topics 94

7 Stepping Motors 97
7.1 Permanent Magnet Stepping Motors 98
7.2 Stepping Sequence 98
7.3 Excitation Sequence 99
7.4 Physical Configuration 100
7.5 Pulse Excitation 100
7.6 Variable Reluctance Stepping Motors 101
7.7 Stepping Motor Performance 102
7.7.1 Resonance 102
7.7.2 Static Operation 103
7.7.3 Dynamic Behavior 103
7.8 Thermal Characteristics 105
7.9 Software Stepping Motor Control 105
7.10 Fractional Stepping 107
7.10.1 Half Stepping 107
7.10.2 Microstepping 108
7.11 Torque Characteristics 110

7.12 Problems and Discussion Topics 111

8 DC Motors 113
8.1 Coil–Field Interaction 113
8.2 Commutation 114
8.3 Operating Characteristics 116
8.4 Motor-Driven System 117
8.5 Generators/Tachometers 118
8.6 Brush Problems 119
8.7 DC Motor Types 119
8.7.1 Field-Wound Motors 119
8.7.2 Permanent Magnet Motors 119
8.7.3 Ironless Core Motors 120
8.7.4 Linear Motors 120
8.8 Impedance Matching 120
8.8.1 Optimum Gear Ratio 121
8.9 Thermal Characteristics 122
8.10 Motor Control 123
8.10.1 Voltage Control 124
8.10.2 Torque–Current Control 124
8.10.3 Velocity Control 124
8.10.4 Dynamic Compensation 125
8.10.5 Position Control 127
8.11 Brushless Motors 128
8.11.1 Brushless Motor Configuration 132
8.11.2 Pros and Cons of Brushless Motors 133
8.12 Computer Interface Requirements 133
8.12.1 Supervisory Control 134
8.12.2 Direct Digital Control 134
8.12.3 Instrument and Actuation Interfaces 135
8.13 Problems and Discussion Topics 135

9 Analog ↔ Digital Conversion 136
9.1 Coding 139
9.2 Digital-to-Analog Conversion 140
9.3 Flash Analog-to-Digital Conversion 143
9.4 Successive-Approximation A/D 144
9.5 Integrating Converters 146
9.6 Sigma-Delta One-Bit Converters 148
9.6.1 Delta Modulation 149
9.6.2 Sigma–Delta Modulation 149
9.6.3 Sigma–Delta Analog-to-Digital Converter 150
9.6.4 Sigma–Delta Digital-to-Analog Converters 152
9.6.5 Sigma–Delta Design Considerations 155
9.7 Sampling 156

9.7.1 Aliasing 156
9.7.2 Oversampling 158
9.8 Problems and Discussion Topics 159

10 Position and Velocity Measurement 161
10.1 Analog/Digital: Precision, Range, and Accuracy 162
10.1.1 Analog Velocity Measurement 163
10.1.2 Noise and Precision 163
10.1.3 Range 164
10.1.4 Velocity Control 164
10.2 Pulse Measurement of Velocity 167
10.2.1 Pulse Generation Devices 167
10.2.2 Frequency-to-Voltage Converters 168
10.2.3 Logic Measurement of Frequency 168
10.2.4 Software Measurement of Frequency 169
10.2.5 Precision in Pulse Measurement of Frequency 169
10.2.6 Period Measurement 170
10.3 Analog Position Measurement 171
10.4 Incremental Encoders 173
10.4.1 Quadrature 173
10.4.2 Reliability 175
10.4.3 Decoding Technologies 175
10.4.4 Optical Shutter 177
10.4.5 Microdecoding 177
10.4.6 Velocity From Encoders 178
10.4.7 Linear and Rotary Encoders 178
10.5 Laser Interferometry 179
10.6 Synchros and Resolvers 180
10.6.1 Inductive Coupling 180
10.6.2 Input-Output Relationships 181
10.6.3 Conversion to Position and Velocity Signals 182
10.6.4 Velocity 186
10.6.5 Resolver-to-Digital Converters 186
10.6.6 Rotary/Linear Conversion, Multistage 187
10.7 Absolute Encoders 187
10.8 Problems and Discussion Topics 190

11 Operational Amplifiers for Analog Signal Processing 193
11.1 The High-Gain DC Amplifier 194
11.2 Computing Functions Using Inverting Amplifier 196
11.2.1 Static Linear Functions 196
11.2.2 Dynamic Linear Functions 196
11.2.3 Analog Computers 198
11.2.4 Nonlinear Functions 200
11.2.5 Comparator 203

11.3 Follower Configurations 204
11.4 Digital-to-Analog Converters 206
11.5 Functional Characteristics 208
11.5.1 741 Op-Amp 209
11.5.2 Open-Loop Gain 209
11.5.3 Input Impedance 209
11.5.4 Output Impedance 210
11.5.5 Input Offset Voltage 210
11.5.6 Bandwidth 210
11.6 Problems and Discussion Topics 210

12 Power Amplifiers 213
12.1 Introduction 213
12.1.1 Overview 213
12.1.2 Voltage Output vs. Current Output 214
12.1.3 Linear vs. PWM Amplifiers 216
12.2 Power Transistors 218
12.2.1 Background 218
12.2.2 Bipolar Transistors 219
12.2.3 MOSFET Transistors 222
12.3 Linear Amplifiers 223
12.3.1 Class B Output Stage 223
12.3.2 Reducing Crossover Distortion 225
12.3.3 Using Feedback within the Amplifier 225
12.3.4 Thermal Stability 227
12.3.5 Variations on the Class A-B Output 228
12.4 PWM Amplifiers 229
12.4.1 Basic Operation 229
12.4.2 PWM Input From an Analog Source 229
12.4.3 PWM Input From a Digital Source 231
12.4.4 Signal Conditioning 231
12.5 Power Op-Amps 233
12.5.1 Overview 233
12.5.2 Advantages and Disadvantages 233
12.5.3 Application Hints 233
12.6 Adding Robustness and Troubleshooting 233
12.6.1 Power Supply Considerations 233
12.6.2 Thermal Considerations 234
12.7 Problems and Discussion Topics 235
Bibliography 237
Index 239
