Contents

PREFACE, *ix*

1 CONTROL SYSTEMS ENGINEERING, 1

1.1 Introduction, 1
1.2 Systems, System Models, and Control Techniques, 1
1.3 A Brief History, 2
1.4 The Classification of Control Techniques, 7
1.5 The Design Process, 10
References, 12

2 MODELING PHYSICAL SYSTEMS: DIFFERENTIAL EQUATION MODELS, 13

2.1 Introduction, 13
2.2 Linear System Characteristics, 13
2.3 Modeling with Lumped Linear Elements, 15
2.4 An Automotive Application, 26
2.5 Power and Energy Considerations, 27
2.6 Nonlinear Models, 30
2.7 Summary, 34
2.8 Connections to Further Study, 35
References, 36
Problems, 36

3 TRANSFER-FUNCTION MODELS, 43

3.1 Introduction, 43
3.2 Using Laplace Transforms, 44
3.3 Transfer Functions and Block Diagrams, 50
3.4 Using Signal-Flow Graphs, 56
3.5 Some Subsystem Models, 60
3.6 Control System Applications, 68
3.7 Order Reduction, 71
3.8 Modeling using MATLAB, 72
3.9 Modeling using SIMULINK, 75
3.10 Summary, 77
3.11 Connections to Further Study, 78
References, 78
Problems, 79

4 STATE MODELS, 85

4.1 Introduction, 85
4.2 Linear System Models, 86
4.3 Characteristics of Linear System Solutions, 92
4.4 State Diagrams, 95
4.5 Conversions between Transfer-Function and State Models, 97
4.6 Nonlinear Models, 103
4.7 Block Diagrams Composed of State Models, 104
4.8 Managing State Models with MATLAB or SIMULINK, 105
4.9 Summary, 107
4.10 Connections to Further Study, 108
References, 108
Problems, 108

5 SIMULATION, 113

5.1 Introduction, 113
5.2 Analog Simulation as an Academic Tool, 114
5.3 Digital Simulation with Linear System Models, 119
5.4 Nonlinear System Simulation, 126
5.5 Simulation Using MATLAB, 127

5.6 A Control System Application, 129
5.7 Simulation using SIMULINK, 133
5.8 Summary, 136
5.9 Connections to Further Study, 137
References, 138
Problems, 138

6 STABILITY, 143

6.1 Introduction, 143
6.2 Stability Criteria as Applied to Transfer-Function Models, 144
6.3 Stability Criteria as Applied to Linear State Models, 147
6.4 Stability Tests, 148
6.5 Using MATLAB, 153
6.6 Summary, 153
6.7 Connections to Further Study, 154
References, 154
Problems, 155

7 PERFORMANCE CRITERIA AND SOME EFFECTS OF FEEDBACK, 157

7.1 Introduction, 157
7.2 Transient Performance Criteria, 158
7.3 Frequency-Response Criteria, 169
7.4 Spectral Selectivity and Noise Bandwidth, 176
7.5 Steady-State Error, 180
7.6 Disturbance Rejection, 193
7.7 Sensitivity, 195
7.8 Summary, 199
7.9 Connections to Further Study, 200
References, 201
Problems, 201

8 ROOT-LOCUS TECHNIQUES, 207

8.1 Introduction, 207
8.2 Some Developmental Concepts, 208
8.3 The Rules of Construction, 213

8.4 Examples, 221
8.5 Root-Locus Variations, 223
8.6 Root-Locus Construction using MATLAB, 225
8.7 A Design Example, 227
8.8 Summary, 232
8.9 Connections to Further Study, 233
References, 234
Problems, 234

9 FREQUENCY-RESPONSE TECHNIQUES, 237

9.1 Introduction, 237
9.2 Phasor-Algebra Models and Graphical Variations, 237
9.3 Bode Plots and Relative Stability Criteria, 239
9.4 Polar Plots and the Nyquist Stability Criterion, 248
9.5 The Correlation of Open-Loop and Closed-Loop Characteristics, 255
9.6 An Application: Systems With Transportation Delay, 259
9.7 Frequency-Response Plots using MATLAB, 262
9.8 Summary, 265
9.9 Connections to Further Study, 266
Problems, 266

10 CASCADE CONTROLLER DESIGN, 271

10.1 Introduction, 271
10.2 The Proportional Controller, 271
10.3 The PI Controller, 272
10.4 The Ideal PD Controller, 280
10.5 The Practical PD Controller, 283
10.6 The PID Controller, 288
10.7 The Phase-Lead Controller, 292
10.8 The Phase-Lag Controller, 296
10.9 The Lead-Lag Controller, 300
10.10 Selecting a Cascade Controller, 303
10.11 Using MATLAB, 304
10.12 Summary, 306
10.13 Connections to Further Study, 307
Problems, 307

11 CONTROLLER DESIGN VARIATIONS, 313

11.1 Introduction, 313
11.2 Pole Placement Using State Feedback, 313
11.3 State-Estimation, 324
11.4 Output Feedback, 326
11.5 Transfer-Function-Based Pole Placement, 329
11.6 Tracking With Feedforward Anticipation, 333
11.7 Using MATLAB, 336
11.8 Summary, 338
Problems, 339

12 NONLINEAR MODELS AND SIMULATION, 343

12.1 Introduction, 343
12.2 Linear and Nonlinear System Models: Distinguishing Properties, 344
12.3 State Space and the Phase Plane, 345
12.4 Simulation with a Saturation Characteristic, 348
12.5 Simulation with a Discrete-Level Controller, 352
12.6 Simulation with Nonlinear Friction, 365
12.7 Summary, 373
12.8 Connections to Further Study, 374
References, 374
Problems, 375

13 NONLINEAR SYSTEMS: ANALYTICAL TECHNIQUES, 377

13.1 Introduction, 377
13.2 Equilibrium States and Nominal Set Points, 377
13.3 Linearization, 378
13.4 Describing Functions, 382
13.5 Summary, 391
References, 392
Problems, 392

14 THE APPLICATION OF DISCRETE-EVENT CONTROL TECHNIQUES, 395

14.1 Introduction, 395
14.2 State-Transition Techniques, 396
14.3 Traditional Control Techniques, 404
14.4 Concurrent Control, 408
14.5 Hierarchic Control, 411
14.6 Summary, 415

15 DESIGN EXAMPLES, 421

15.1 Introduction, 421
15.2 A Vehicle Cruise Control, 421
15.3 A Phase-Locked Motor Speed Control, 425
15.4 Control of an Orbiting Satellite, 430
15.5 The MATLAB Code, 437
References, 438

APPENDIX A ANGLES AND INTERCEPTS OF ROOT-LOCUS ASYMPTOTES, 439

APPENDIX B MATLAB: INTRODUCTORY INFORMATION, 441

INDEX, 447
